

ABSTRACT OF THE DISCLOSURE

1 A digital camera supplies images to a first computer of a
2 network via a receiver which is enabled as a bridge for
3 Bluetooth, wireless LAN and infrared transmission from a
4 digital camera. Once a digital camera is registered in a
5 computer system, transmissions from the camera can be
6 transmitted to the receiving first computer and thereafter
7 transferred over the network for creation of a multi-media
8 file which can be viewed at a private network or
9 Internet accessible second computer.
